ABSTRACT

In this modern world science improved a lot, but still now most of the people lack awareness about diabetes. Due to life style and food habit changes are the major cause for the diabetes .diabetes is the term roughly translate as excessive sweet urine. There are three types of diabetes type 1 type 2 and gestational diabetes. Main causes include lack of physical work, obesity, and life style modification. Symptoms of diabetes are polydipsia and polyuria etc.prevalence of diabetes shows that India will be in first rank in the diabetic population in 2030. many medications are used for controlling diabetes like allopahy, ayurveda etc.In allopahic medicines the drugs like metformin , glibenclamide etc. plays a major role meanwhile, In ayurveda, the plants like neem, bitter guard,bael fruit, etc. are also helps to control. One of the best way is to control the diabetes is to increase physical work, avoid of consuming junk foods. Moreover people should consume ragi and other low carbohydrate content foods will help to maintain the diet and prevent from diabetes.

Keywords: Diabetes, WHO, Mortality, Morbidity, Prevalence, Allopathy, Ayurveda.

INTRODUCTION

Diabetes is a life long disorder, which is markedly affected by day to day variations in diet, exercise, infection and stress. These factors have to be addressed on daily basis while managing diabetes and the patient is the person best equipped to deal with the situation. Hence, a thorough knowledge of the disease and how it alters normal body functions and the awareness of its acute and chronic complications is necessary .it enables the diabetic patient to take better care of him or herself. Awareness of diabetes, its complications and better health care has proved to improve the long term outlook of this disease. The management of diabetes is intimately linked to food therefore; knowledge about food and nutrition and the scientific base of biochemistry, physiology, and pathogenesis go a long way towards the understanding and dealing with the disorder.

Diabetes is major cause of morbidity and mortality world wide. The word diabetes is from the Greek diabanein which means to pass through, in reference to the excessive urine produced as a symptom of these diseases. And the term diabetes without qualification usually refers to diabetes mellitus, which roughly translates to excessive sweet urine (known as "glycosuria").

Several rare conditions are also named diabetes. The most common of these is diabetes insipidus in which large amounts of urine are produced (polyuria), which is not sweet (insipidus meaning "without taste" in Latin) Diabetes mellitus appears to have been a death sentence in the ancient era. Hippocrates makes no mention of it, which may indicate that he felt the disease was incurable. Aretaeus did attempt to treat it but could not give a good prognosis; he commented that "life (with diabetes) is short, disgusting and painful".

Sushruta (6th century BCE) identified diabetes and classified it as Medhumeha. He further identified it with obesity and sedentary lifestyle, advising exercises to help "cure" it. The ancient Indians tested for diabetes by observing whether ants were attracted to a person’s urine, and called the ailment "sweet urine disease" (Madhumeha).

Types of Diabetes

Majorly diabetes can be classified into three broad classification, they are type 1, type 2, and 3, gestational diabetes.

Type 1 diabetes mellitus is characterized by loss of the insulin-producing beta cells of the islets of Langerhans in the pancreas leading to insulin deficiency. This type of diabetes can be further classified as immune-mediated or idiopathic. The majority of type 1 diabetes is of the immune-mediated nature, where beta cell loss is a T-cell mediated autoimmune attack.

There is no known preventive measure against type 1 diabetes. Most affected people are otherwise healthy and of a healthy weight when onset occurs. Sensitivity and responsiveness to insulin are usually normal, especially in the early stages. It was traditionally termed "juvenile diabetes" because it represents a majority of the diabetes cases in children.

It is formerly non-insulin-dependent diabetes mellitus (NIDDM) or adult-onset diabetes .it is a metabolic disorder that is characterized by high blood glucose in the context of insulin resistance and relative insulin deficiency. Diabetes is often initially managed by increasing exercise and dietary modification. As the condition progresses, medications may be needed. Unlike type 1 diabetes, there is very little tendency toward ketoacidosis though it is not unheard of. One effect that can occur is nonketonic hyperglycemia. Long-term complications from high blood sugar can include increased risk of heart attacks, strokes, amputation, and kidney failure.

In other words, it is a non-autoimmune, complex, heterogeneous and polygenic metabolic disease condition in which the body fails to produce enough insulin, characterized by abnormal glucose homeostasis. Its pathogenesis appears to involve complex interactions between genetic and environmental factors. It occurs when impaired insulin effectiveness is accompanied by the failure to produce sufficient β-cell insulin.

Gestational diabetes is one of the diabetes mellitus conditions which occur in a non-diabetic pregnancy woman. This condition usually develops near the end of the 3rd trimester or the beginning of the 4th trimester. This condition usually returns to normal soon after delivery. It affects the way the body uses glucose. Glucose is used by the cells in the body for fuel for growth and energy. Abnormal glucose levels while pregnant can be extremely harmful to both the mother and the baby.

A 2008 study completed in the U.S. found that the number of American women entering pregnancy with preexisting diabetes is increasing. In fact the rate of diabetes in expectant mothers has more than doubled in the past 6 years.
Latent autoimmune diabetes of adults (LADA) is a condition in which Type 1 diabetes develops in adults. Adults with LADA are frequently initially misdiagnosed as having Type 2 diabetes, based on age rather than etiology.

Pre-diabetes indicates a condition that occurs when a person’s blood glucose levels are higher than normal but not high enough for a diagnosis of type 2 diabetes. Many people destined to develop type 2 diabetes spend many years in a state of pre-diabetes which has been termed “America’s largest healthcare epidemic”.

Causes of Diabetes

Diabetes having so many causes they are, In type 1 diabetes is also partly inherited and then triggered by certain infections, with some evidence pointing at Coxsackie B4 virus. There is a genetic susceptibility in individual susceptibility to some of these triggers which has been traced to particular HLA genotypes these are the genetic “self” identifiers relied upon by the immune system.

In case of type 2 diabetes, it is due to a combination of lifestyle. And genetic factors. The other causes include age, obesity, food habit modification, etc.

Several Numbers of changes in life and food habit modifications is happened among the people in the name of modern trend and fashion. In one study, those who had high levels of physical activity, a healthy diet, did not smoke, and consumed alcohol in moderation had an 82% lower rate of diabetes. When a normal weight was included the rate was 89% lower. In this study a healthy diet was defined as one high in fiber, with a high polyunsaturated to saturated fat ratio, and a lower mean glycemic index.

The other major risk factor is obesity. It has been found to contribute to approximately 55% of cases of type 2 diabetes.

The association between increasing body mass index (BMI) and greater weight gain and risk of diabetes is most pronounced among Asians, suggesting that lower cut off BMI values are needed to identify Asians at a higher risk of diabetes. BMI cut point for Indians for any cardio-metabolic risk factors is 23 kg/min both sexes, whereas that of waist circumference (WC) is. 87 cm for men and 82 cm for women. In case of abdominal adiposity, there is also a probable indication that there is a preferential abdominal adiposity in Indians irrespective of the degree of general adiposity.

Now a days the working pattern of people are also changed, the work patterns from labour to sedentary, the increase in computerization and mechanization, and improved transport are just a few of the changes that have had an impact on human metabolism in recent days the increased rate of childhood obesity in between the 1960s and 2000s is believed to have led to the increase in type 2 diabetes in children and adolescents. Some other causes like Genes significantly associated with developing type 2 diabetes include TCF7L2, PPARG, FTO, KNC111, NOTCH2, WFS1, CDKAL1, IGF2BP2, SLC30A8, JAZF1, and HHEX. Monogenic forms, e.g., MODY, constitute 1–5% of all cases.

The other major causes for diabetes are represented in the following table.

Signs and Symptoms

The classical symptoms of diabetes are polyuria (frequent urination), polydipsia (increased thirst), and polyphagia (increased hunger). The classical symptoms of diabetes are polyuria (frequent urination), polydipsia (increased thirst) and polyphagia (increased hunger). The signs and symptoms of diabetes include:

- Frequent urination
- Increased thirst
- Increased hunger
- Fatigue
- Unintentional weight loss
- Blurred vision
- Vaginal infections
- Slow wound healing

Hyperosmolar nonketotic state, which is more common in type 2 diabetes, is mainly the result of dehydration. Often, the patient has been drinking extreme amounts of sugar-containing drinks, leading to a vicious circle in regard to the water loss. A number of skin rashes can occur in diabetes that is collectively known as diabetic dermadesmoses.

Diagnosis

The World Health Organization definition of diabetes is for a single blood test indicating diabetes in children and adolescents. In cases of rapid vision change, whereas with type 2 changes are generally more gradual, but should still be suspected.

In type 1 diabetes the people usually may also present with diabetic ketoacidosis, a state of metabolic dysregulation characterized by the smell of acetone; a rapid, deep breathing known as Kussmaul breathing, nausea, vomiting and abdominal pain; and an altered states of consciousness. A rarer but equally severe possibility is hyperosmolar nonketotic state, which is more common in type 2 diabetes and is mainly the result of dehydration.

Often, the patient has been drinking extreme amounts of sugar-containing drinks, leading to a vicious circle in regard to the water loss. A number of skin rashes can occur in diabetes that is collectively known as diabetic dermadesmoses.

Diagnosis

The World Health Organization definition of diabetes is for a single raised glucose reading with symptoms otherwise raised values on two occasions, of either:

- Fasting plasma glucose ≥ 7.0 mmol/l (126 mg/dl)
- Or
- With a glucose tolerance test, two hours after the oral dose a plasma glucose ≥ 11.1 mmol/l (200 mg/dl)

Morbidity and Mortality of Diabetes

Global Morbidity and Mortality associated with Diabetes

It is close to four million deaths in the age group of 20-79 years in 2010. Accounting for 6.8% of global all-cause mortality in this age group in 2010, IDF 2006 reported >50 million diabetes people in South East Asia. Approximately 7.97 million DALYs were lost because of diabetes.

Graph 1: mortality of diabetes

Diabetes Morbidity and Mortality in India

Prevalence

The number of cases of diabetes worldwide in the year 2000 among adults was estimated to be 171 million and will rise to 366 million by 2030.

Graph 2: prevalence of diabetes in developed countries

The National Diabetes Information Clearinghouse estimates that diabetes costs $132 billion in the United States alone every year. About 5%-10% of diabetes cases in North America are type 1. The fraction of type 1 in other parts of the world differs. Most of this difference is not currently understood.

Graph 4: prevalence of diabetes in world:

India stands first in the diabetic population this table will give a clear information about the top ten countries having high diabetic population.
Regarding with the prevalence of type 2 diabetes, CURES has demonstrated that the awareness about diabetes in urban areas is extremely low, nearly 25% of the residents, moreover even among the diabetic subjects, the knowledge and awareness about complications was poor and less than 50% knew that diabetes is preventable. This graph shows that the prevalence of diabetes is high in between the age group of 40-49.

**Graph 5: prevalence of type 2 diabetes**

Treatment

Type 1 treatments usually include combinations of regular or NPH insulin, and/or synthetic insulin analogs. And for the treatment of type 2 diabetes mainly people are preferred oral medications the oral drugs, classes include sulfonylureas, biguanides, Alpha-glycosidase inhibitors, Thiazolidinediones, Meglitinides

**Sulfonylureas**

Drugs

Tobutamide, chlorpropamide these are the drugs in the first generation. In second generation drugs like glibenclamide, glipizide, glinazide, glimepiride etc

**Side Effects**

- low blood sugar,
- an upset stomach,
- skin rash or itching,
- Weight gain.

**Biguanides**

Drugs

Metformin

**Side Effects**

- Abdominal pain
- Nausea
- Metallic taste
- Mild diarrhea
- Anorexia

**Alpha-glycosidase inhibitors**

Drugs

Acarbose and miglitol

**Side Effects**

may cause stomach problems such as gas, bloating and diarrhea

**Thiazolidinediones**

Drugs

Pioglitazone and troglitazone

**Side Effects**

- Plasma volume expansion
- Edema
- Weight gain
- Headache
Myalgia
Mild anaemia

**Meglitinides**

*Repaglinide and nateglinide*

**Side Effects**
- Weight gain
- Low blood sugar

**Plants Used in the Treatment of Diabetes**

Plants play a major role in controlling diabetes from early times compare to allopathic medications it is not showing any side effects so recent days the people are returning to natural medications some of the plants used in the treatment are:

- *Aegle marmelos* Corr (baelfruit)
- *Azadirachta indica* Ajuss (neem tree)
- *Emblica officinalis* S Gaertn (gooseberry)
- *Momordica charantia* Linn (bitter guard)
- *Jatropha curcas* Linn (bio diesel plant)
- *Acacia catechu* W&A (Leguminosae)
- *Aerva lanata* Juss (Amarantaceae)
- *Alpinia calcarata* Ros (Zingiberaceae)
- *Benincasa hispida* Thunb (Cucurbitaceae)
- *Capsicum annum* Linn (Solanceae)
- *Cedrus deodara* Roxb (Coniferae)
- *Coccinia indica* W&A (Cucurbitaceae)
- *Eugenia jambolana* Lam (Myrtaceae)
- *Ficus gibosa* Bl (Moraceae)
- *Ficus glomerata* Roxb (Moraceae)
- *Helicteres isora* Linn (Sterculiaceae)
- *Holostemma annulare* K.Schum (Asclepiadaceae)
- *Plumbago rosea* Linn (Plumbaginaceae)
- *Rubia cordifolia* Linn (Rubiaceae)
- *Salacia oblonga* Wall (Hippocrateaceae)
- *Saraca indica* Linn (Leguminosae)
- *Strobi lanthus hynaeus* Nees (Acanthaceae)
- *Tinospora cordifolia* Miers (Menispermaceae)
- *Tragia involucrata* Linn (Euphorbiaceae)
- *Tribulus terrestris* Linn (Zygophyllaceae)

*et these are the plants having the activity of controlling the diabetes.*

**Management of Diabetes**

It is a chronic disease which is difficult to cure. Management concentrates on keeping blood sugar levels as close to normal ("euglycemia") as possible without presenting undue patient danger. This can usually be with close dietary management, exercise, and use of appropriate medications (insulin only in the case of type 1 diabetes mellitus). Oral medications may be used in the case of type 2 diabetes, as well as insulin. Patient education, understanding, and participation is vital since the complications of diabetes are far less common and less severe in people who have well-managed blood sugar level. Wider health problems may accelerate the deleterious effects of diabetes. These include smoking, elevated cholesterol levels, obesity, high blood pressure, and lack of regular exercise.

**CONCLUSION**

India is considering as a diabetes capital of the world. In recent days most of the youths are affected by diabetes because lack of physical work. In the name of modernization all the daily activities are carried by the machines to make the work easy, but it makes the life difficult to managing the diabetes. Low calorie food items like raita etc., are eradicated by the pizza and burger it paves a way to obesity. Atlast due to the life style modification, it gives diabetes as a gift to the people so, eradicated by the pizza and burger it paves a way to obesity. Atlast due to the life style modification, it gives diabetes as a gift to the people so, eradicated by the pizza and burger it paves a way to obesity. Atlast due to the life style modification, it gives diabetes as a gift to the people so, eradicated by the pizza and burger it paves a way to obesity. Atlast due to the life style modification, it gives diabetes as a gift to the people so, eradicated by the pizza and burger it paves a way to obesity.
