ABSTRACT
Hemorrhoids are one of the most common gastrointestinal disorders seen by the general practitioners. Hemorrhoids have several treatment modalities and diagnosis. In initial stages conservative treatments can be applied, but over a period when the hemorrhoids get worst, the disease should be treated by several non-operative treatments like, Sclerotherapy, rubber band ligation, infrared photocoagulation, cryotherapy, bipolar diathermy, and direct-current electrotherapy. When hemorrhoids cannot be addressed by non-surgical treatment, normal or alternative method like surgical methods is applied. There are several over the counter herbal medicine (oral & ointment base creams), available as botanicals for hemorrhoids. It has been proved by scientific studies that botanicals improve microcirculation, capillary flow, vascular tone, and to strength the connective tissue of the perivascular amorphous substrate.

Keywords: Hemorrhoids, Botanicals, Gastrointestinal disorder, Photocoagulation

INTRODUCTION
Hemorrhoids or piles are a common ailment among adults. More than half of men and women aged 50 years and older will develop hemorrhoid symptoms during their lifetime. Hemorrhoids are rare in children but now days several reports state the occurrence of hemorrhoids in children, and in elderly people. In United States three-quarter of individuals have hemorrhoids at some point in their lives, and about half of them over age 50 required treatment, and much smaller percentage approximately 4% seek medical treatment for the condition. Hospital based proctoscopy studies show prevalence rates of hemorrhoids with a symptomatic state in 86% of patient. According to The Merck Manual definition hemorrhoids is “Varicosities of the veins of the hemorrhoidal plexus, often complicated by inflammation, thrombosis, and bleeding”. But a recent definition of hemorrhoids is “Vascular cushions, consisting of thick submucosa containing both venous and arterial blood vessels”.

Chronological inspection of Hemorrhoids
It has been estimated that hemorrhoids can affect both men and women. Hemorrhoids are mentioned in ancient medical writings of every culture. The word “hemorrhoids” is derived from the Greek “haema”= blood, and “rhoos”= flowing, and was originally used by Hippocrates to describe the flow of blood from the veins of the anus. Commonly in society it is known as piles, the word pile is derived from Latin, meaning a ball or a mass, as this condition may not always be accompanied by bleeding, the word piles is better used for this condition. John Andrene remarks that common people call them piles and the aristocracy calls them hemorrhoids, the French call them figs, means to clot.

Histology of hemorrhoids
Hemorrhoidal tissue, cushions of tissue within the anal canal that contain blood vessels and supporting tissue made up of muscle and elastic tissue, are present in all individuals. Universally hemorrhoids are classified according to anatomical origin as shown in fig 1. Internal hemorrhoids are consisting of redundant mucus membrane of the anal canal with the origin above the dentate (anorectal) line, and external hemorrhoids have an epithelial component and originate below the dental line. Internal hemorrhoids or true hemorrhoids are further graded based on the extent to which the tissue descends in to the anal canal. First degree Hemorrhoids ”The mucosa barely prolapse, but with severe straining may be trapped by the closing of the anal sphincter. Subsequently, venous congestion occurs occasionally, resulting in discomfort and/or bleeding”. Second degree Hemorrhoids ”With further protrusion of the mucosa, the patient complains of an obvious lump, but this disappears spontaneously and rapidly after defecation unless thrombosis occurs” Third degree Hemorrhoids “In chronic hemorrhoidal disease, the persistent prolapsing produces dilatation of the anal sphincter, and the hemorrhoids protrude with minimal provocation and usually require manual replacement”. Fourth degree Hemorrhoids “These are usually described as external hemorrhoids and are protruding all the time unless the patient replaces them, lies down, or elevates the foot of the bed. In these four degree hemorrhoids, the dentate line also distends, and there is a variable external component consisting of redundant, permanent perianal skin”. On basis of lithotomy position there are usually three major hemorrhoidal cushions originated to the right posterior, right anterior, and left lateral position known as 3,7, and 11 o’clock position of the anal.

Fig. 1: Schematic presentation of types of Hemorrhoids

Diagnosis of hemorrhoids
Patient with rectal discomfort, swelling, pain, discharge, and bleeding at the time of defecation, it is prudent not to assume it is a result of hemorrhoids, a full evaluation is necessary, including a rectal examination, a proctoscopic examination, and in some cases a sigmoidoscopy or colonoscopy. The doctor will examine the anus and rectum to look for swollen blood vessels that indicate hemorrhoids and will also perform a close rectal exam with gloved,
lubricated finger to feel for abnormalities, with an anoscope a hollow lighted tube useful for view of internal hemorrhoids. Pain is absent unless complications supervene, for this reason, any patient complaining of ‘painful hemorrhoids’ must be suspected of having another condition, and examine accordingly. Several other diseases like rectal or anal carcinoma, colon cancer, and other digestive problem produce same symptoms like hemorrhoids, so it is advisable to see a doctor if patient have any rectal bleeding.

**Causes of hemorrhoids**

The actual cause of hemorrhoids is not known. Few of the earliest proposed cause include temperament, body habits, customs, passions, sedentary life, tight-laced clothes, climate, and seasons. Hemorrhoids are common in patients with spinal-cord injuries, constipation, chronic diarrhea, poor bathroom habits, postponing bowel movements, and a poor-fiber diet are also considered to be contributing causes. By recent studies implicate gravity intrinsic weakness of the blood vessel wall, heredity, genetic predisposition, increased intra-abdominal pressure from many causes, including prolonged forceful valsalva defecation, obstruction of venous outflow secondary to pregnancy, and constipated stool in the rectal ampulla. Alcoholic cirrhosis or other causes of portal obstruction can cause severe hemorrhoids. More rarely but much more importantly, haemorrhoids may reflect collateral anastomotic channels that develop as a result of portal hypertension.

**Treatment of hemorrhoids**

The natural evolution of hemorrhoids is benign but hemorrhoids tend to get worse over time, and it should be treated as soon as it occurs. The best treatment is always prevention. Despite thousands of years and millions of patients with pain, discomfort and perceived embarrassment of hemorrhoids, exact natural cause of hemorrhoids is yet not clear so slandered treatment are, at best, imperfect, but several surgical and non-surgical techniques are used to treat hemorrhoids.

**Non-operative Treatment**

Numbers of methods that do not involve surgical excision are available to treat patients with hemorrhoids. These procedures are usually performed in the office setting and do not require anesthesia.

**Sclerotherapy**

Morgan in Dublin first described it in 1869, and it is reserved for first and second-degree hemorrhoids. A submucosal injection of 5 ml of 5 % phenol in oil, 5 % quinine and urea, or hyper tonic (23.4 %) salt solution at the base of the hemorrhoidal complex causes thrombosis of vessels, sclerosis of connective tissue, and shrinkage and fixation of overlying mucosa. It takes only minutes to perform though an anoscope. Khoury et al., performed trial and found 89.9 % of the patient's quared, who had initially been treated with medical therapy. Sclerotherapy is minimally invasive it cause some complications, like pain variably reported in 12 % - 70 % of patients, Impotence, urinary retention & abscess, anaphylactic shock.

**Cryotherapy**

Cryotherapy used for internal hemorrhoids, and in which enlarged internal hemorrhoids destroyed, initial report related efficacy of techniques were enthusiastic. It is a time consuming techniques as compare the techniques and subsequent reports have shown disappointing results. Complications with cryotherapy are prolonged pain, foul-smelling discharge, and greater need for addition therapy. It is cumbersome to perform and is associated with severe rectal pain and discharge. So now days cryotherapy is rarely used for treatment of hemorrhoids patients.

**Rubber Band Ligation (RBL)**

Rubber Band Ligation is most commonly used for first-second or third degree hemorrhoids. Some authorities also recommended RBL for fourth degree hemorrhoids after operative reduction of the incarcerated prolapse. RBL relies on tight encirclement of redundant mucosa connective tissue and blood vessels in the hemorrhoidal complex. Internal hemorrhoids ligation can be performed in the office setting with one of several commercially available advance instruments so procedure becomes a one-person effort. Endoscopic variceal ligators have also been shown to be effective tools for hemorrhoid ligation. In one session RBL can be performed up to 3 hemorrhoids. About 80 % of success rate was found by Wroblewski et al with five years of follow-up after treatment.

The most common complication of RBL is pain, reported in 5 % -60 % of treated patients. Other complication with RBL is abscess, urinary retention, band slippage, prolapse and thrombosis of adjacent hemorrhoids, and bleeding from ulcer occur in < 5 % of patients. Nectrotizing pelvic sepsis (rare complication) prolapse and bleeding were the most frequent reoccurrent symptoms.

**Bipolar Diathermy**

Bipolar diathermy is applied one-second pulse of 20 W until the underlying tissue coagulates. Several complications like pain, bleeding, fissure or spasm of the internal spincter was observed in about 12% of the patients. For second and third degree hemorrhoids multiple application of bipolar diathermy to the same site are required. Successes rate in bipolar diathermy was ranging from 89% to 100%. Prolapsing tissue does not eliminate by bipolar diathermy and up to 20 % patients will required excisional hemorrhoidectomy.

**Direct-Current electrotherapy**

Direct current electro coagulation was utilized in 1876, and explained by Wilbur E. Keesey, MD in 1934, but doctors today oddly considered it as one of the new generation of modalities. Direct-current electrotherapy required the prolonged up to 14 minutes application of 110-V direct current to the base of hemorrhoidal complex well above the transition zone. Bipolar diathermy is applied in the office setting with one of several commercially available advance instruments so procedure becomes a one-person effort. Complication observed after direct-current therapy was pain (33%), ulcer formation (4%), and bleeding (10 %).

**Infrared photocoadulation (IRC)**

IRC was introduced in late seventies by Nath. In IRC coagulation of the tissue is done by focuses of infrared radiation from a tungsten-halogen lamp via a polymer probe tip. During the IRC treatment mechanical presser and radiation energy are applied simultaneously in a manner that can eliminate the disadvantage occur in electro coagulation like grounding the patients & charring of the tissue. At one time 2-6 hemorrhoids can be treated by IRC treatments.

As such IRC is free from any hazards and has proved to be an effective and safe method for treatment of early grade bleeding internal hemorrhoids, while in electro coagulation an obvious risk of electric current passing through the body, which may cause pain full muscular spasms. By the randomized studies with IRC, 67%-96% of success rates of patients with first or second degree bleeding hemorrhoids has been reported.

**Surgical or operative Treatment**

In normal cases hemorrhoidal diseases can be treated by the dietary modifications topical medications. But in certain cases surgical procedure are necessary to provide satisfactory long-term relief in cases involving a greater degree prolapses, a variety of operative techniques are employed to address the problem. Hemorrhoidal surgery is known as hemorrhoidectomy, in hemorrhoidectomy the actual cause of hemorrhoids is not known. Few of the earliest proposed cause include temperament, body habits, customs, passions, sedentary life, tight-laced clothes, climate, and seasons.
techniques include excising internal & external components in 1-3 quadrants around the anal canal. Banding of internal hemorrhoids and excising the external component or performing a circular excision of the internal hemorrhoids and prolapsing rectal mucosa proximal to the dentate line. Recurrence following a properly performed hemorrhoidectomy is uncommon. Surgical hemorrhoidectomy can be performed with either open or closed techniques. Open hemorrhoidectomy known as Milligan-Morgan hemorrhoidectomy in which the internal & external components of each hemorrhoid are excised and the skin is left open in a 3-leaf clover pattern that heals secondarily for 4-8 weeks. Techniques developed in 1937 at UK and widely performed there. Closed hemorrhoidectomy developed in US in 1952, and it is known as Ferguson hemorrhoidectomy, in which each hemorrhoid component is excised and the wounds are closed primarily.

The complication with varied frequency occurred in hemorrhoidectomy such as urinary retention 2%-36%, anal stenosis 0%-6%, infection 0.5%-5.5%, and incontinence 2%-12%. Sphincter defect also noted up to 12% of patients. Alternative approach to conventional hemorrhoidectomy is stapled hemorrhoidectomy (SH), was introduced in 1993 and first described by Longo in 1998, by modifying the circular stapling device commonly used for low rectal anastomoses. This technique also known as another name like stapled anoplasty, stapled circumferential mucosectomy, Longo’s hemorrhoidectomy, stapled anapexy, stapled prolapsectomy, and stapled hemorrhoidopexy, PPH techniques.

Due to the several complications like severe pain and bleeding, operation cost because of postpartum hemorrhages (PPH) device, length of stay, rectal perforation, retroperitoneal sepsis, pelvic sepsis. Smooth muscle fiber detected in stapled that some from internal anal sphincter procedure has not been adopted widely in United states and Canada, only some reports coming from the North America. Several randomized trials were done to compare PPH with open hemorrhoidectomy, and found PPH is to be as effective’s conventional surgery. For grade three and grade four hemorrhoids PPH is the effective with the potential to involve less pain and a shorter recovery time than conventional hemorrhoidectomy.

**Treatment of hemorrhoids with Botanicals**

Medicinal plants are grouped for many commercial purposes in the broader category ‘medicinal and aromatic plants’ (MAPs), covering not only plants used medicinally, but also for neighboring and overlapping purposes, for instance as foods, condiments and cosmetics. The term ‘botanicals’ is becoming commonly used for a wide range of plant-based products. It is estimated that 70-80% of people worldwide rely chiefly on traditional, largely herbal medicine to meet their primary healthcare needs. The global demand for herbal medicine is not only large, but also growing. The world market for herbal remedies in 1999 was calculated to be worth US$ 19.4 billion, with Europe in the lead (US$ 6.7 billion), followed by Asia (US$ 5.1 billion), North America (US$ 4.0 billion), Japan (US$ 2.2 billion), and then the rest of the world (US$ 1.4 billion). Based on human studies ayurvedic medicinal plant uses, classified as following according to the treatment categories (Fig.2), and for different gastrointestinal disease, 12% of plants are used.

**Ruscus aculeatus** (Butcher’s Broom)

Plant has long history of clinical use as a treatment of hemorrhoids and it is approved by German Commission E. Butcher's broom is typically administered in capsule form and frequently paired with trimethyl hesperidin chalcone a flavonoid complex and ascorbic acids, with free radical scavenging properties, to the pathogenesis of hemorrhoids and varicose veins.
alcoholic extracts, and in the form of tea. The active biochemical constitutes is proposed to be the saponin in glycoside ruscogenin.  

Plants is well known for its pharmacological properties like anti-inflammatory and astringent, which is responsible for increasing venous tone, a positive step for hemorrhoid treatments. Bennani et al carried out open-label multicenter study with 124 patients and 69% of efficacy of plant as anthemorrhoidal was found. Patients treated with butcher's broom were showed statistically significant improvement in a variety of symptoms like pain, local signs, and overall severity, after seven days. Plant well studied in chronic vascular insufficiency (CVI), and scientific research and clinical evidence in support that this traditional folk medicines uses. Plant extract reported for its in vivo inhibition of elastase-a part of the enzyme involved in degrading perivascular structural component. In one study plant extract given orally was reduced capillary filtration rate and decrease ten percent venous capacity, within two hours of administration. Hemorrhoids is common among pregnant women and surgery treatment is very difficult, in such condition butcher's broom showed a improvement in maternal symptoms without any negative effects on the fetus, and with high degree of safety.

**Aesculus hippocastanum (Horse Chestnut)**

Plant is the most widely prescribed oral remedy for venous edema in Germany, some twenty clinical trials studies for the CVI and found positive effects, and so German Commission E has approved the use of plant extract for CVI treatment, other reports support the use of plants for the treatment of CVI. The active component of the horse chestnut seed extracts (HCSE) is thought to complex mixture of saponin, collective referred as aescins, it also contain flavonoids and tannins. Recent studies showed pharmacodynamic actions like anti-oxidative and anti-inflammatory, venotonic and free-radical scavenging properties of horse chestnut is attributed to the aescins. In vitro studies showed HCSE inhibit activity of elastase & hyaluronidase enzymes, responsible for degradation of proteoglycan degradation of the capillary endothelium and extra vascular matrix. A randomized partially blinded placebo-controlled study showed HCSE reduce abnormally increased capillary permeability and associated edema. An HCSE study using rats showed 200mg/kg body weight of aescin effectively reduced increased vascular permeability, induced by both acetic acid and histamine, and inhibited hind paw edema induced by carrageenin. In-depth systematic review of double blind, placebo-controlled trials of oral HCSE on 1,083 patients with CVI were done and conclude HCSE is safe and effective in the symptomatic short-term treatment of CVI. In one double blinded placebo-controlled study, with acute symptomatic hemorrhoids patients, showed that 40 mg aescin administered three times per day for up to two months reduced symptoms, reduction in bleeding, and swelling.

**Collinsonia canadensis (Stone root)**

The eclectic physicians found stone root is useful in-patient with sings of congestion, Kathyl A & Eric Y found stone root will often rapidly resolve hemorrhoids symptoms and they favor its use in these types of individuals. Phytochemical research on stone root showing that it contains falvonoids and saponin, and isolated falvonoids have been shown to be of benefit for hemorrhoids patients.

**Centella asiatica (Gotu kolu)**

*Centella asiatica* topical medicinal plant with active constitute asiaticoside, first isolated and purified in 1940, and first systematic clinical studies were carried out in 1954; other active metabolites used in pharmaceutical preparations are titrated for the pentacyclic tri terpenes derivatives like asiatic acid, madecassic acid, and asiaticoside. Rigorous clinical investigation of *Centella asiatica* has been conducted on CVI and varicose veins. Centella has the potential to enhance connective tissue integrity, elevated antioxidant level in wound healing, and improve capillary permeability. A randomized multcenter, placebo-controlled double-blind study with Centella extract in the treatment of venous insufficiency, resulted in significant improvement in symptoms of heaviness in the lower limbs, venous distensibility.

The Centella extract was shown to reduce serum level of lysosomal enzyme involved in the degradation of mucopolysaccharides – one of the main component of the amorphous cellular matrix that maintain vascular integrity, which is a positive effect of Centella extract on pathogenesis of varicose veins. In one double-blind, placebo-controlled study the effect of TTFCA (total triterpenoid fraction of *Centella asiatica*) extract was administered orally and after for week significant results were found, reduced capillary filtration rate, and improvement in microcirculation and other clinical symptoms, and locally applied TTFCA extract three times daily can help to patients with varicose vein disorder including hemorrhoids and varicose veins.

**Hamamelis virginiana (Witch Hazel)**

Plant is native to North America, and plant has a long history for treatment of hemorrhoids. Witch hazel extract contain volatile oil, falvonoids and tannins. Witch hazel has a long therapeutic tradition used primarily for its astringent, anti-inflammatory and local haemostatic effects. Bark of plants typically used in hemorrhoids and varicose vein, minor injuries of the skin, and local inflammation of the skin.

</table>
In European countries and America herbalists typically use witch hazel both as internal and topical remedy for hemorrhoids, and thus both the European Scientific Cooperative on phytotherapy and France have approved the herb's combined used for treatments of hemorrhoids. 

In vitro study of witch hazel extract show plant extract inhibit α-glucosidase and human leukocyte elastase enzyme which contribute to the degradation of connective tissue, extract also exhibited a strong anti-inflammatory effect in the croton oil ear edema test in the mouse. Apart from these plants several other plants are use in various form for the treatment of hemorrhoids, and they are component of polyherbal formulation. In table 1 plant are described with their scientific name, useful part, family, and reference, which are reported antihemorrhoidal properties alone or in combined with other herbs.

**Topical treatments**

In tropical treatment of hemorrhoids to assist locally in calming inflammation and for stopping bleeding and swelling are highly useful. The late Rudolf Fritz Weiss a German physiotherapist, favored the best treatment of acute hemorrhoids with wet compress, he also recommended arnica compresses using 1-2 teaspoons of arnica tincture per half-liter of water for compress. Alternatively he suggested the use of an oak decoction or a chamomile infusion for acute hemorrhoids.

_Hamamelis Virginiana_ alone will often suffice to sooth minor symptoms of acute inflammation; effect of these plants is attribute to presence of tannin in the plant. Several cream based ointments, essential oils are available in markets over the counter drugs for the topical treatment of hemorrhoids, like Neo Healer’s Piles Treatment Cream®, Hemorrhoids No More® 137, and Piles ointment from Gelfarma International.

**Flavonoids and Tocotrienols for hemorrhoids treatment**

A number of flavonoids have been reported to have anti-inflammatory effects and to strengthen blood vessels, so many preparations made for treatment of hemorrhoids, from purified or crude extracts of flavonoids. Several scientific studies favored treatment of hemorrhoids with flavonoids. But scientific study showed that all flavonoids couldn't provide the effective treatment for acute hemorrhoids. Recent study regarding the flavonoids and symptomatic hemorrhoids was carried out by Alonso et al and they reported, reduction in the risk of bleeding, persistent pain, itching, and reoccurrence, but yet more in-depth study with effective methodological quality needed for the apparent beneficial effects of flavonoids for the treatment of hemorrhoids.

Flavonoids particularly diosmin, oligomeric proanthocyanidin complexes (OPCs) and hesperidin, have demonstrated efficacy in the treatment of hemorrhoids and varicose veins. These flavonoids exhibit phlebotonic activity, vasculoprotective effects and antagonism of the biochemical mediators of inflammation.

Animal studies have shown flavonoids reduce neutrophil activation, mediate inflammation, and decrease soluble endothelial adhesion molecules. Human trials have shown the ability of flavonoids to improve venous tone and vein elasticity assessed by plethysmography, and significant improvement in CVI, venous leg ulcers, and hemorrhoids. Hemorrhoids treatment during the pregnancy is bit difficult by injection, RBL, and surgery and these techniques are contraindicated, and flavonoid treatment is the best option, clinical trials shows treatment did not affect pregnancy, fetal development, birth weight, infant growth and feeding.

Prof. Jacques Nasquelin, France have first received patent for the method of isolation of OPSc from pine bark, in 1951, and form grape seeds in 1970. In vitro studies shows OPSc to inhibit the enzymes hyaluronidase, elastase, and collagenase, also reported for their antioxidant and free radical scavenging properties, and OPSc have demonstrated preferential binding to areas characterized by a high content of glycosaminoglycans such as the capillary walls, these properties make them effective in decreasing vascular function, and peripheral circulation, which is the beneficial for the treatment of hemorrhoids.

Tocotrienols are collectively known as vitamin E, and are identical in structure to tocopherols except for the degree of saturation in their side chain, having properties of antioxidant. Tocotrienols are found in high concentration in palm oil and rice bran oil, and are well investigated for their nutrient ional, antioxidant activity, cholesterol lowering, anti-cancer effects and protection against atherosclerosis. In double-blind placebo-controlled clinical trials tocotrienols found to be improvement in overall symptoms of hemorrhoids.

**Hydrotherapy and Dietary approaches to Hemorrhoids**

Dietary habit is the key link for the number of diseases, and diet therapy for hemorrhoids is a widely accepted modality. High fiber diet with commercial fiber supplements and bhenough oral fluids to produce soft, well-formed and regular bowel movements, high fiber diet is an important component to the prevention and treatment of both hemorrhoids and varicose veins.

One old myth regarding the diet and hemorrhoids is that "spicy food, including red hot chilli powder, produces hemorrhoid symptoms". Recently one randomized controlled double-blind trial reported no evidence to support this myth.

The warm sitz bath is the hydrotherapy recommended for the conditions associated with increased pelvic congestion, it is non-invasive therapy for uncomplicated hemorrhoids and varicose veins, but requires a high degree of patient’s compliance.

**Medical/Drug Treatment**

Effective medical/drug therapy is useful to control the acute phase (bleeding) so that definitive therapy like banding, injection sclerotherapy, IRC cryotherapy, and surgery can be scheduled at a convenient time. Several modern and traditional drugs (oral/local) are being increasingly used in all grades of symptomatic hemorrhoids. Drugs like psyllium husk, corticosteroid creams Nitroglycerin ointment, calcium dobesilate, nifedipine. Other poly herbal drugs also well studied for the treatment of the hemorrhoids such as Falton 50® from Les Laboratories, France. Preparation H® Hemorrhoidal Cooling Gel from Wyeth, Madison, New Jersey, Soft gel Capsules from Gelfamma International.
A haemorrhoid is a common discomfort, that is getting worse by prolonging immediate treatment, in the adult, which directly affect the economy. Apart from the prominent symptoms of bleeding and pain, colonoscopy and proctoscopy give the correct state of condition. Non-operative treatment methods are used for the patients with the first second and third degree hemorrhoids; very few patients with fourth degree haemorrhoids need surgery call treatment. As in case of every disease prevention is the best common treatment, haemorrhoids can also be reduced by changes in life style, diet habit, and intake of appropriate dose of respective botanicals, which can also intervene in the pathogenesis to decrease vascular integrity.
