ABSTRACT

Anethum graveolens contained essential oils, fatty oil, proteins, carbohydrates, furanocoumarin, polyphenols, mineral and many other biologically active constituents. It is widely used traditionally. The pharmacological studies showed that Anethum graveolens induced antimicrobial, anti-inflammatory, analgesic, gastric mucosal protective and antisecretory effects, smooth muscle relaxant effect, hyperlipidaemic, increased progesterone concentration, and many other effects. This review will highlight the chemical constituent and pharmacological effects of Anethum graveolens.

Keywords: Anethum graveolens, Dill, chemistry, Pharmacology

INTRODUCTION

Anethum graveolens, belong to the family Umbelliferae, is indigenous to southern Europe. It is an annual herb growing in the Mediterranean region, central and southern Asia. Now it is cultivated widely throughout the world [1-4]. It is used traditionally as a popular aromatic herb and spice that has a very long history of use going back to more than 5,000 years. It was used as a remedy for indigestion and flatulence and as milk secretion stimulant. Moreover, it is used as an anti-convulsion, anti-emetic, anti-cram in (children), as a wound healer and to increase the appetite and strengthen the stomach [5-7].

Anethum graveolens contained essential oils, fatty oil, moisture (8.39%), proteins (15.68%), carbohydrates (36%), fiber (14.80%), ash (9.8%), furanocoumarin, polyphenols and mineral [6-13].

Previous studies showed that Anethum graveolens induced antimicrobial, anti-inflammatory, analgesic, gastric mucosal protective and antisecretory effects, smooth muscle relaxant effect, hyperlipidaemic, increased progesterone concentration, and many other effects. The aim of the present review is to highlight the chemical constituent and pharmacological effects of Anethum graveolens.

Synonyms: Pastinaca anethum Spreng, Peucedanum graveolens Benth. and Selinum anethum Roth.

Parts used medicinally: Fruit, leaf, and essential oil

Physicochemical properties [6-9]:

Foreign organic matter: not more than 2.0%, total ash: not more than 11.0%, acid-insoluble ash: not more than 1.5%, water-soluble extractive: not less than 15.0%, and alcohol-soluble extractive: not less than 4.0%.

Chemical constituents

Anethum graveolens contained essential oils, fatty oil, moisture (8.39%), proteins (15.68%), carbohydrates (36%), fiber (14.80%), ash (9.8%) and mineral elements such as calcium, potassium, magnesium, phosphorous, sodium, vitamin A and niacin. Fruits of Anethum graveolens contain 1 - 4% essential oil comprising of major compounds: carvone (30 - 60%), limonene (33%), α-phellandrene (20.61%), including pinene, diterpene, dihydrcarvone, cineole, myrcene, para myrcene, dillapiole, isomyristicin, myristicin, myristin, apioi and dillapioi. Anethum graveolens essential oil also contained furanocoumarin, 5-(4′-hydroxy-3-methyl-2′-butenloxy)-6, 7-furocoumarin, oxypeucedanin, oxypeucedanin hydrate and falcarindiol [6, 10-12].

The total phenol and total flavonoid contents of Anethum graveolens L. extract were 105.2 mg of gallic acid equivalents/g of the dried extract and 58.2 mg of catechin equivalents/g of the dried extract, respectively [13].

Pharmacological effects

Antimicrobial effects

The essential oil and different extracts of Anethum graveolens seeds exerted antimicrobial activity against wide range of microorganisms. The essential oils and acetone extracts shown antimicrobial activity against Staphylococcus aureus, Bacillus cereus, Enterococcus faecalis, Listeria monocytogenes, Escherichia coli, Yersinia enterocolitica, Salmonella choleraesuis, S typhimurium, Shigella flexneri, Salmonella typhi, Pseudomonas aeruginosa, and Mycobacterium. Anethum graveolens seed extracts have also been reported to possess anti-ulcer activity, and have shown moderate activity against Helicobacter pylori. Aqueous and organic extracts of seeds have exhibited potent antibacterial activity. The essential oils also active against three fungi (a yeast, Candida albicans and two molds, Penicillium (isandicum and Aspergillus flavus). D-limonene and D-carvone, have exhibited strong antifungal activity against Aspergillus niger, Saccharomyces cerevisiae and Candida albicans. Many authors mentioned that the antimicrobial activities could be attributed to furanocoumarin in Anethum graveolens [11, 14-22].

Anti-inflammatory and analgesic effects

The hydro alcoholic extract of the Anethum graveolens seed caused significant decrease in the inflammation and pain in rats [23]. Anethum graveolens oil and diclofenac-gel showed a significant (p < 0.001) decrease in the paw volume in rats compared to the blank group. Anethum graveolens oil showed even more decrease in the paw volume compared to the diclofenac [24].

A single topical application of an ethanol extract of the fruits to the inner and outer surface of the ear of mice inhibited ear inflammation induced by 12-O- etodecanoylphorbol-13 acetate by 60% [25].

A 10% aqueous extract of the fruits and 5% aqueous solution of the essential oil had analgesic effects in mice pain induced by hot plate and acetic acid writhing models. The effect of the fruits (1.0 g/kg body weight) was comparable to 200 mg / Kg body weight of acetyl salicylic acid [26].
Effects on gastrointestinal system:

A. graveolens seed extracts possessed significant mucosal protective and anti-secretory effects in the gastric mucosal lesions induced in mice by oral administration of HCl (1 N) and absolute ethanol. The acidity and total acid content were reduced by the orally or intraperitoneally administration of the extracts [27]. Anethum graveolens seed extracts exerted moderate activity against Helicobacter pylori [28]. The essential oil of Anethum graveolens reduced contractions of rabbit intestine [29]. Ethanol extract inhibited acetylcholine and histamine induced contractions of guinea-pig ileum [30]. Dill seeds have been used as household remedy to relief digestive problems such as stomachache, indigestion and flatulence. Dill water is believed to have a soothing effect and is given to babies to treat grippe, relieve hiccup and colic [7]. The essential oil was a mild carminative and reduced foaming in vitro [31].

Hyperlipidaemic effects

The crude extract of Anethum graveolens L. showed anti-hypercholesterolaemic and anti-hyperlipidaemic activities. The crude extracts of A. graveolens L. besides having strong anti-hyperlipidaemic effects, it improved the biological antioxidant status by reducing lipid peroxidation in liver and modulating the activities of antioxidant enzymes in rats fed with high fat [32-34]. Treatment of hyperlipidaemic rats with defatted ethanolic Anethum graveolens L. extract (single daily dose of 1 ml, equivalent to 500 mg of the plant powder) and high-fat diet for up to 10 and/or 30 days reversed the serum lipid levels compared to rats which were fed only high-fat diet. In addition, it induced significant increase in HMG-CoA/acetate levels [35]. Intradivine administration of 12.5 mg/kg body weight of 70% dried ethanol extract of the fruits dissolved in normal saline or 4.0 μl/kg body weight of the essential oil induced diuresis and enhanced sodium and calcium excretion in dogs [36]. Intradivine administration of 5–10 mg/kg body weight of 5% seed oil in saline to cats caused hypotension and increased respiration volume [2-4].

Effects on reproductive system

The effects of Anethum graveolens L. (dill) extracts on female reproductive system were studied in female rats. The experimental groups were fed 0.045 g/kg and 0.45 g/kg of ethanol extract for 10 days. Treatment with high dose of the extract resulted in a significant increase in duration of the estrous cycle and diestrus phase. Smooth endoplasmic reticulum (SER), rough endoplasmic reticulum (RER) and mitochondria were increased in granulosa cells in high dose groups. There were no significant statistical differences in amount of serum estradiol between experimental, control and sham groups but the serum progesterone concentration increased significantly in high dose treatment group compared with control and sham groups [36].

Dill seed possessed contractive effects on myometer, enhanced releasing of oxytocin which is an effective hormone in uterus contractions.A dose of 6-7 gm of dill seed extract after delivery decreases postpartum hemorrhage due to its contractive characteristic. Limonene and anethole showed contractive effect on uterine myometrium [37-40].

Zagamii et al. carried out a clinical study to evaluate the effect of Dill seed on uterine contractions in active phase of labor. 40 women used Dill seed infusion (one tablespoon of whole dill seed steeped in a half or whole cup boiling water for 3-4 min before going to the hospital at the beginning of uterine contractions), and 60 women used nothing in the control group. Interpretatable electronic fetal monitoring was obtained for half an hour at the beginning of the active phase. The Fall: Rise ratio was calculated by measuring the duration of time for a contraction to return to its baseline from its peak (fall) divided to the duration of its rise time to its peak (rise).The number of contractions in the treated group was significantly more than the control group. The ratio of contraction’s fall time to its rise time in the treated group was shorter than the control group. The study showed that dill seed shortens duration of the first stage of labor [41].

Contraindication and adverse effects

It was safe, but rarely and in sporadic cases, it caused allergic reactions, oral pruritus, tongue and throat swelling, urticaria, vomiting and diarrhea. It was not recommended during pregnancy. The maximum non-fatal doses of aqueous and ethanolic extracts in mice were 0.45 g/kg and 5 g/kg (ip), respectively. LD50 values of the aqueous and ethanolic extracts were 3.04 g/kg, (ip) and 6.98 g/kg, (ip) respectively [27, 42-44].

Dosage

The average daily dose of the seeds is 3 g; essential oil is 0.1-0.3 g [5, 44-45].

CONCLUSION

Anethum graveolens is a plant with wide range of chemical constituents which exerted hypolipidaemic activity in rats [34]. Intradivine administration of 12.5 mg/kg body weight of 70% dried ethanol extract of the fruits dissolved in normal saline or 4.0 μl/kg body weight of the essential oil induced diuresis and enhanced sodium and calcium excretion in dogs [36]. Intradivine administration of 5–10 mg/kg body weight of 5% seed oil in saline to cats caused hypotension and increased respiration volume [2-4].
